Nucleic Acids Res. 22:2547-2551(1994).
-!- FUNCTION: CONTROL OF TOPOLOGICAL STATES OF DNA BY TRANSIENT
BREAKAGE AND SUBSEQUENT REJOINING OF DNA STRANDS. TOPOISOMERASE II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MAKES DOUBLE-STRAND BREAKS.
CATALYTIC ACTIVITY: AFP-dependent breakage, passage and rejoining
of double-stranded DNA.
SUBUNIT: Homodimer (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

-! FUNCTION: THE FUNCTION OF BRAIN MAPS IS ESSENTIALLY UNKNOWN.

PHOSPHORYLATED MAPIB MAY PLAY A ROLE IN THE CYTOSKELETAL CHANGES THAT ACCOMPANY MEDRIAE EXTENSION. POSSIBLY MAPIB BINDS TO AT LEAST TWO TUBULIN SUBDNITS IN THE POLYMER, AND THIS BRIDGING OF SUBUNITS MIGHT BE INVOLVED IN NUCLEATING MICROTUBULE POLYMERIZATION AND IN
                                                                                                                                                                                                                                                                                                                                                                                                                      STABLIZING MCKCYUBULES.
SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE WITH MAPLA AND MAPLE PROTEINS.
WITH MAPLA AND MAPLE PROTEINS.
KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPLE to microtubules.
FYM: LC1 is coexpressed with MAPLE. It is a polypeptide generated from MAPLE by proteolytic processing. It is free to associate with both MAPLE (By similarity).
SIMILARITY: TO MAPLE.
                                                                                                                                  01-NOV-1995 (Rel. 32, Created)

"Primary structure of the COOH-terminal membranous segment of a penicillin-sensitive enzyme purified from two Bacilli.";
J. Biol. Chem. 256:2067-2077(1981).
-!- FUNCTION: REMOYES C-TERMINAL D-ALANYL RESIDUES FROM SUGAR-PEPTIDE CELL WALL PRECURSORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "Reduced heat resistance of mutant spores after cloning and mutagenesis of the Bacillus subtilis gene encoding penicillin-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- CATALYTIC ACTIVITY: D-alanyl-D-alanine + H(2)O = 2 D-alanine.
-!- PATHWAY: Peptidoglycan synthesis; final stages.
-!- SUBCELLUIAR LOCATION: Membrane-associated.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SII; ALSO KNOWN AS THE D-ALANYL-D-ALANINE CARBOXYPEPTIDASE I FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          68 LSKOTFIKPVFK-KIEEKKEEENKPTFDVSKKKDNPQVNHSQLNESHRKEDLQRE---- 121
                                                                                          WITH MAPIA AND MAPIB PROTEINS.

BURNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE MITH MAPIA AND MAPIB PROTEINS.

DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

PTM: LC1 IS COEXPRESED WITH MAPIB: IT IS A POLYPEPTIDE GENERATED FROM MAPIB BY PROTECLYIC PROCESSING: IT IS PREE TO ASSOCIATE WITH MAPIA AND MAPIB. IT INTERACTS WITH THE AMINO-TERMINAL REGION
FUNCTION: THE FUNCTION OF BRAIN MAPS IS ESSENTIALLY UNKNOWN. PHOSPHORYLATED MAPIB MAY PLAY A ROLE IN THE CYTOSKELETAL CHANGES THAT ACCOMPANY NEURITE EXTENSION. POSSIBLY MAPIB BINDS TO AT LEAST TWO TUBULIN SUBUNITS IN THE POLYMER, AND THIS BRIDGING OF SUBUNITS MIGHT BE INVOLVED IN NUCLEATING MICROTUBULE POLYMERIZATION AND IN STABILLIZING MICROTUBULES.

"Differential regulation of microctubule-associated protein 1B (MAP1B)
in rat CNS and PNS during development.";

J. Neurosci. Res. 49:319-332(1997).

-i- FUNCTION: The function of brain MAPS is essentially unknown.
Phosphorylated MAP1B may play a role in the cytoskeletal changes
that accompany neurite extension. Possibly MAP1B Binds to at least
two tubulin subunits in the polymer, and this bridging of subunits
might be involved in nucleating microtubule polymerization and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MAPB_RAT STANDARD; PRT;

                              nerve levels are high early in development but decrease du postnatal development and are low in adults. In dorsal roo ganglia levels remain high throughout development. INDUCTION: By nerve growth factor. INDUCTION: By nerve growth factor. DOMAIN: Has a highly basic region with many copies of the EXEE and KKEI/V, repeated but not at fixed intervals, whice responsible for the binding of MAPIB to microtubules. PTW: LC1 is coexpressed with MAPIB. It is a polypeptide get
                                                                                                                                                                                                                 SUBUNIT: 3 different light chains, LC1, LC2 and with MAP1A and MAP1B proteins.
TISSUE SPECIFICITY: Nervous system (spinal cord, cerebellum and cerebrum). Not expressed in liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .
